On Jan 13, 2001 this sequence version replaced gi:11878000.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         \boldsymbol{\omega}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2188
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2308

On Nov 15, 2002 this sequence version replaced gi:23101222.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Worley, K.C.

L Submitted (08-OCT-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Sep 23, 2002 this sequence version replaced gi:21737759.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome sequence and whole genome shotgun sequence reads. Both end sequences and whole genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Worley, K.C.

            Ş
                                                                                                                                        This is the DNA sequence of a human methylthioadenosine phosphorylase C (MTAse) genomic DNA clone that was isolated from a cosmid gene library using an MTAse cDNA probe. The encoded enzyme catabolises methylthioadenosine to adenine for endogenous salvage incorporation into the intracellular AMP pool. The invention relates to methods for treating and preventing the onset and maintenance of multiple drug resistance (MDR) in animals undergoing cancer chemotherapy. In the methods provided, cells are depleted of AMP and ATP and are thus unable to supprt P-C glycoprotein activity. One method obtains a population of target cells are treated with a purine synthesis inhibitor, such as L-alanosine, which starves the cells of adenine and suppresses P-glycoprotein activity. The Starves the cells of adenine and suppresses P-glycoprotein activity. The small-cell lung cancer cells, acute lymphoblastic leukemia cells comprising cells or urothelial tumor cells, preferably primary tumour cells comprising cells are also treated for MDR with purine synthesis inhibitors. MTAse competent and deficient cells are also treated for malignancy with other canti-cancer drugs. MTase sequence-specific oligonucleotides can be used to detect the presence or absence of MTAse in malignant cell lines
                                                                             Query Ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of detecting methylthicadenosine phosphorylase (MTAse) comprising adding oligonucleotide probes hybridisable to MTAse encoding nucleic acid to an assayable sample of cells, where the presence of the nucleic acid indicates the presence of the MTAse in a cell. The inventive method is simple and efficient in detecting the presence of MTAse in the mammalian cell. The availability of the recombinant MTAse enables the production of highly pure material with greater ease and in greater quantities than was obtained using Rangione method for the isolation and purification of native MTAse. This sequence encodes rat methylthicadenosine phosphorylase (MTAse)

                                                                                                                                                                                                                                      The sequence encodes a methylthioadenosine-phosphorylase, and is located at chromosome-9p21. A cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene (AAT15157-58) is located between this gene and an interferon-alpha gene cluster, and has been isolated by chromosome walking. The CDK4I gene, probe and primer derivatives and the gene product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus syndrome), glioma, non-small cell lung carcinoma or leukaemia. The gene may also be used in cancer gene therapy, or in antitumour antisense oligonucleotide or ribozyme construction. Antibodies against CDK4I may be used in diagnosis or in vivo imaging

This DNA sequence comprises human genomic DNA for methylthioadenosine phosphorylase (MTase), obtained from a cosmid gene library constructed from human placenta DNA by screening with a MTase cDNA probe. A claimed method for inhibiting the activity adenylsuccinate synthetase (ASS) in mammalian cells deficient in MTAse activity involves: (a) determining that a population of cells obtained from a mammalian host is MTase deficient; and (b) administering an ASS inhibitor (preferably L-C depleted of AMP. The method is especially used to treat human MTAse-C deficient primary tumour cells, specifically non-small cell lung cancer, acute lymphoblastic leukaemia (ALL), glioma and urothelial tumour cells. MTAse catabolises methylthioadenosine to adenine for endogenous salvage in selective killing of substrate for de novo synthesis of AMP, resulting coligonuclotides can be used to detect the presence or absence of MTAse in malignant cell lines
                                                                                                                                                                                                              Query Matc

This invention describes a novel method for detecting catalytically active and inactive methylthioadenosine phosphorylase (MTAse) in mammalian cells, using oligonucleotide probes which hybridize to MTAse nucleic acid coding regions. Detection of MTAse encoding nucleic acid indicates the cell has catalytically active MTAse. The method is useful for detecting malignant cells with a deficient MTAse gene, useful for identifying malignant cells which are suitable targets for methionine (MET) starvation therapy. The new method is simple, efficient and successful at determining MTAse negative cells, unlike prior art cultures, which include analysis of catalytic activity in cell cultures, requiring a commercially unavailable radiochemical substrate, and immunoassays, using MTAse antibodies which are unable to be produced in sufficient quantities. Recombinant MTAse protein produced using the new polynucleotide and vector, allows greater and purer production of
                                                                                                                                                                               Detecting catalytically active and inactive methylthicadenosine phosphorylase (MTAse) in mammalian cells useful for identifying recells which are suitable targets for methionine (MET) starvation
                                                                                                                                                                                                                            WPI;

                                                        The present invention relates to novel tumour suppressor genes, termed as cyclin-dependent kinase 4 inhibitor (CDK4I) genes and their corresponding proteins. The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human methylthicadenosine phosphorylase (MTAse) genomic DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                     exon

                                                                                                                                                                                                                                                                                                                             ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins cencoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide cencoded by (I) is useful for detecting cancer in a patient sample, and concleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I) in a cell. A probe/primer derived of cells from a patient. (I) is useful for determining the phenotype of cells in a sample concerning the patient of cells in a sample concerning the patient. (I) is useful for determining the presence of cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
                                                                                                                                                                                        Query Match

                                                                                                                                                        멼
                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                           AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent Sequences used in the exemplification of the present invention. N.B. Dages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                          Query Match

cc invention also relates to nucleic acid sequences (ADC29919-CC invention also relates to nucleic acid sequences (ADC39919-ADC31860). The creation also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody compound which binds to a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The cinvention further discloses methods of polypeptide of the invention; and methods of invention further discloses methods of polypeptide of the invention. The conting sequences corresponding to the cDNA sequences of the invention of conting sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the cidatification of mutations responsible for genetic discreters of the also used for treating biodiversity, and in producing many other types of discase and other neurodegenerative diseases, anaemia, platelet cidscorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or comprisers, and in the recombinant production of a portein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from WIPO at the sequence data for the supplements. The present sequence represents a specifically obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; diagnostic, the parkinson's disease, includiversity assessment; Parkinson's disease, included assessment; platelet disorder; wound; burns; neurodegenerative disease; anaemia; platelet disorder; wound; burns; neurodegenerative disease; cancer; ulcers; osteopath marker; food supplement; antiparkinsonian; nootropic neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatective; chromosome 3; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating codisorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zhou P, Ghosn M
Haley-Vicente D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2003-371981/35

                                     This invention relates to novel combination therapies that selectively kill methylthioadenosine phosphorylase (MTAP) deficient cells. The combination therapies comprise administering an inhibitor of glycinamide ribonucleotide formyltransferase (GARFT) and/or aminoimidazolecarboximide ribonucleotide formyltransferase (AICARFT), and administering an anticombination therapies can be used for selectively killing MTAP deficient cells, and for treating cell proliferative disorders e.g. lung cancer, leukaemia, glioma, urothelial cancer, colon cancer, breast cancer, prostate cancer, pancreatic cancer skin cancer and head and neck cancer. The anti-toxicity agent counteracts the toxicity of the inhibitor in the MTAP-competent (i.e. healthy) cells and increases the maximally tolerated dose of the inhibitor. This polynucleotide sequence represents the cloned when the invention
                                                                                                                                                                                                                                                                                                                                                                                 Bloom LA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              명
                                                                                          The present sequence is one of a large number of 5' ESTs derived from C mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from C total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA C libraries. Such ESTs are not well suited for isolating cDNA sequences are derived from mRNAs and even in those cases where longer C cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in C diagnostic, forensic, gene therapy and chromosome mapping procedures.                                                                                                                                        Ħ
                                                                                                                                   thrombospondin 1 (THBS1) or THBS4 genes. The invention also nucleic acid comprising allelic variant of polymorphic region r THBS4 gene. The method is useful for identifying a subject as e for a particular clinical course of therapy or to treat a isease or disorder and for selecting a clinical course of treat a subject who is at risk for developing a vascular disorder. The present sequence is human THBS4 reference gene. sequence is said to encode SEQ ID NO: 4 (AAE36229). However not appear to be the case

Sequence 1, Application US/09780114

Patent No. US20020146695Alori, Tsutomu
Carson, Dennis A.
Takabayashi, Kenji
TITLE OF INVENTION: Method for Detection of the Presence or Absence of Methylthioadenosine Phosphorylase
(MTASe) in a

NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS:
ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: California
COUNTRY: USA
ADDRESSEE: Townsend and Townsend and Crew LLP
STATE: P4111-3834
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
OPERATION SYSTEM: C-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION NUMBER: US/09/780,114
FILING DATE: 09-Feb-2001
CLASSIFICATION NUMBER: US/09/780,114
FILING DATE: 04-May-1998
APPLICATION NUMBER: US/09/772,914
FILING DATE: US-DEC-1993
APPLICATION NUMBER: US 08/176,855
